

The appropriate blade extension differs depending on the material type and thickness. Before installing the holder in the carriage, turn the holder cap to adjust the blade extension, and then perform trial cutting

Appropriate Blade Extension

- ① End of holder cap
- ② Material that will be cut
- ③ Length of blade tip

Be careful that the blade does not extend too much. If there is too much of a blade extension, the material may not be cut cleanly and the mat will deteriorate quicker.

Adjust the blade extension to slightly exceed the thickness of the material that will be cut. Use the markings on the holder to make the adjustment.

Cutting Settings

Use the following table to select the appropriate settings according to the material that will be cut.

| Material Type | Blade | Scale Setting | Pressure Setting |
|---------------------------------------|----------|---------------|------------------|
| Lightweight paper (vellum) | Standard | 3 | 0 |
| Heavy weight paper (cardstock) | Standard | 4 | 0 |
| Lightweight fabric (cotton fabric) | Standard | 4 | 4 |
| Heavy weight fabric (1-mm-thick felt) | Deep-cut | 5 | 5 |

- Adjust the setting for “Cut Pressure” in the settings screen. For details, see “Settings for specific functions”.
- Use a support sheet or contact sheet when you cut a piece of fabric out. For details, see “Mat and cutting blade combinations”.
- The settings indicated in the table are approximations. The setting will differ depending on the type and thickness of the material to be cut. Be sure to perform a trial cutting first.
